

Show Your Facebook Photos on the Website

Your website can automatically display the photos you post on your Facebook Page — styled to match your Gallery. The code is already built and waiting. It just needs one thing that only you can create: a Facebook access token. This guide walks you through it. No technical knowledge needed — you do the clicking, and we handle everything technical.

First, an honest note about Facebook reviews

Facebook *photos* can appear automatically (this guide). Facebook *reviews* cannot — Meta shut down public access to Page reviews, so no website can pull them. The reliable way to show your best Facebook recommendations is to feature them manually as testimonials on the site. This guide is about **photos**.

How this works

You do the parts that need your Facebook login. Then you send us three values, and we do all the technical work — you never touch the hard part.

You do (needs your account)

- Create a Facebook App (~3 min)
- Grant two read-only permissions
- Copy 3 values and send them to us privately

We do (the technical part)

- Exchange your values into a **long-lived, non-expiring** Page token
- Find your Page's photo access automatically
- Install it and confirm your real photos appear in the Gallery

Good news: it won't keep expiring

Done the proper (long-lived) way we handle for you, the token is effectively permanent. It only breaks if you change your Facebook password or remove the app.

Create a Facebook App (~3 min)

- 1 Go to developers.facebook.com → top-right **My Apps** → **Create App**.
- 2 If asked "What do you want your app to do?", pick **Other** → **Next**.

- 3 App type: **Business** → **Next**.
- 4 Name it **Emcey Brows Website**, add your email → **Create app** (re-enter your Facebook password if prompted).

2 Open Graph API Explorer & grant permissions

- 1 In the left menu (or search) open **Tools** → **Graph API Explorer** — or go to developers.facebook.com/tools/explorer.
- 2 Top-right **Meta App** dropdown → select **Emcey Brows Website**.
- 3 Click **Add a Permission** and tick these two: **pages_show_list** and **pages_read_engagement**. (Both are read-only — they let us read your photos, nothing else.)
- 4 Click **Generate Access Token** → a popup asks you to log in and **allow access to your Emcey Brows page** → approve it.

Why no "app review" is needed

Because it's *your* page and *your* app, Facebook lets you read your own photos immediately — you skip the weeks-long approval process that trips most people up.

3 Send us three values (privately)

Copy these and send them to us

- 1 **App ID** — from your app's **Settings** → **Basic** page.
- 2 **App Secret** — same page, click **Show** to reveal it.
- 3 **Access token** — the long string now showing in the Graph API Explorer box.

Value	Where to find it
App ID	App dashboard → Settings → Basic
App Secret	App dashboard → Settings → Basic → <i>Show</i>
Access token	Tools → Graph API Explorer (the token box)

Then we finish it for you

- Exchange your values into a **long-lived, non-expiring Page token**
- Detect your Page's photo access automatically
- Install it and **load your Gallery to confirm your real Facebook photos appear**

Keep these private — and reset afterwards

The App ID, App Secret, and token are sensitive. Send them privately, never post them publicly. Once everything works, it's good practice to

reset the App Secret

(Settings → Basic) — the long-lived Page token we generate keeps working regardless.

Emcey Brows Aesthetics · Imus, Cavite

Facebook photos appear automatically · Facebook reviews are featured manually · Keep tokens private
