

EMCEY BROWS AESTHETICS · WEBSITE GUIDE

Search Engine Optimisation (SEO) Setup

How to get the website found on Google — what's already built in, the one-time accounts you need to set up, and how to check it's working.

[Google Search Console](#)[Google Business Profile](#)[Sitemap & Schema](#)

Prepared for the Emcey Brows website · Imus, Cavite
Focus: local search ("brows in Imus", "aesthetic clinic Cavite")

i The big picture

SEO is how your website earns free traffic from Google. For a local clinic, two things matter most:

- **Your Google Business Profile** (the Maps listing) — this drives most "near me" and map results.
- **The website's on-page SEO** — titles, descriptions, sitemap, and structured data. **This is already built in.**

What you actually have to do

The technical SEO is done. Your job is mostly account setup: verify the site in *Google Search Console*, submit the sitemap, and keep your *Google Business Profile* accurate. Steps below.

1 Already built into the website ✓

Feature	What it does for you
Page titles & descriptions	What shows as the blue link & grey text in Google results
Open Graph / Twitter cards	Nice preview image & text when the site is shared on Facebook/IG
sitemap.xml	A map of every page, so Google finds them all
robots.txt	Tells search engines what to crawl; links to the sitemap
Structured data (Schema)	Tells Google you're a Beauty Salon — address, hours, phone, services, FAQs — enabling rich results
Verification hook	A built-in slot to paste your Search Console code (Section 2)

One critical setting before launch

The website's address must be set to your **real domain**

. In the site's `.env` file set:

```
NEXT_PUBLIC_SITE_URL=https://www.emceybrows.com
```

This one value feeds the sitemap, links, and all the schema. If it's left as a temporary/ngrok address, Google indexes the wrong URLs.

2 Google Search Console (verify + submit sitemap)

Search Console is Google's free dashboard showing how your site performs in search. Set it up once.

- 1 Go to search.google.com/search-console and sign in with the clinic's Google account.
- 2 Click **Add property** → choose **URL prefix** → enter your full site address (e.g. `https://www.emceybrows.com`).
- 3 Choose the **HTML tag** verification method. Copy the code — it looks like `<meta name="google-site-verification" content="abc123...">`. You only need the `content` value (`abc123...`).
- 4 Give that value to your developer / paste it into the site's `.env` file:

```
GOOGLE_SITE_VERIFICATION=abc123...
```

The website adds the verification tag automatically. Redeploy, then click **Verify** in Search Console.

- 5 Once verified: open **Sitemaps** in the left menu, enter `sitemap.xml`, and click **Submit**.

Tip

Prefer not to redeploy? You can instead verify by *DNS record* or by uploading the HTML file Google offers — any one method is enough.

3 Google Business Profile (most important for local)

For a clinic, the Maps listing usually brings in more customers than the website itself. Claim and polish it.

- 1 Go to business.google.com and search for "**Emcey Brows Aesthetics – Imus.**" Claim it (or create it if missing).
- 2 Complete **every** field: category (e.g. "Beauty salon" / "Eyebrow bar"), address, hours, phone, website link, and services.
- 3 Add lots of **photos** (studio, work, team) — listings with photos get far more clicks.
- 4 Keep the **NAP** — Name, Address, Phone — written *identically* to the website. Consistency boosts local ranking.
- 5 Ask happy clients for **Google reviews** (your website already has a "Write a Google review" button). Reviews strongly affect local ranking.

4 Bing & analytics (optional)

- **Bing Webmaster Tools** — bing.com/webmasters. You can *import* straight from Search Console, or verify with a code placed in `.env` as `BING_SITE_VERIFICATION=...`.
- **Google Analytics 4** — to see visitor numbers. This needs a small developer add-on (not yet installed). Ask your developer to add GA4 if you want traffic stats.

5 A few finishing touches (developer)

Worth asking your developer to complete for full coverage:

Item	Why it matters
Add <code>public/og-image.jpg</code> (1200×630, branded)	Shared links currently have no preview image
Add favicon + app icons	Proper logo in the browser tab & phone home screen
Install Google Analytics 4	Visitor & conversion tracking
Unique titles/descriptions per service page	Better, more specific search listings

Technical details for the developer

A companion file with exact code locations is in the project at `docs/SEO-SETUP.md`.

6 How to check it's working

- 1 **Rich Results Test** — search.google.com/test/rich-results. Paste a page URL; it should detect your *Beauty Salon* and *FAQ* info.
- 2 Visit `https://your-domain/sitemap.xml` and `/robots.txt` — they should show your real domain, not a test address.
- 3 In **Search Console** → **Pages**, watch the number of indexed pages grow over the following days/weeks.
- 4 Paste a page link into the **Facebook Sharing Debugger** to confirm the preview image and title (after the OG image is added).

SEO takes time

Indexing and ranking improvements usually appear over *weeks*, not hours. Keep the Business Profile active and collect reviews steadily.
